

DNA Fingerprinting

In order to guarantee to consumers that what they purchase contains only original KAMUT® khorasan wheat, Kamut International has defined a rigid quality control program for the grain itself, farmers and manufactures. Additionally, Kamut International is sponsoring research for the development of a molecular analysis system to identify the DNA fingerprint of KAMUT® brand khorasan wheat (**Development of a molecular analysis system for the Kamut® khorasan DNA fingerprinting realization**).

The goal of this research is to create a test which can be used on all varieties of finished products to distinguish and evaluate the content of KAMUT® khorasan wheat from the content of all other types of durum and soft wheat, as well as other types of cereals. In this way consumers of products made with KAMUT® khorasan wheat are guaranteed little or no contamination by common wheat and other cereals and are sure to receive all the healthy advantages of KAMUT® khorasan wheat.
